### Introduction

The Zero Discharge of Hazardous Chemicals (ZDHC) Programme is a collaboration of brands, value chain affiliates and associates committed to eliminating hazardous chemicals from the textile and footwear value chain. These organisations are committed to advancing towards zero discharge of hazardous chemicals in the value chain to improve the environment and people's well being, understanding that achieving zero will require time, technology, and innovation.

The ZDHC Programme recognises the value of addressing hazardous substances that may be discharged into the environment during the manufacture of materials used in the textile and footwear industry. That is, hazardous substances that could be used deep within the value chain and not just those substances that could be present in finished goods.

The discharge of wastewater containing hazardous chemicals could have a significant impact on the environment and human health.

In 2015, the ZDHC Programme commission-ed a study to better understand the regula-tory landscape of wastewater discharge regulations and guidelines across the textile industry.

The report of the study – Textile Industry Wastewater Discharge Quality Standards Literature Review – found that:

 Current wastewater regulations are far from requiring zero discharge of hazardous chemicals.

 Wastewater guidelines published by different brands, as well as amongst multibrand consortia, vary greatly.

The conclusion of the report is that there is a need for uniform, global guidance pertaining to wastewater discharge quality, as well as testing and reporting, to enable a more sustainable industry.

The purpose of the ZDHC Programme's Wastewater Guidelines is to define a single, unified expectation concerning wastewater discharge quality that goes beyond regulatory compliance, not only for conventional wastewater parameters, but also for hazardous chemicals.

These guidelines build upon the ZDHC Manufacturing Restricted Substances List (MRSL) - a list of chemical substances banned from intentional use in facilities that process textile materials and trim parts for the textile and footwear industries.

The first step towards the prevention of wastewater contamination is for facilities to avoid the use of restricted chemical substances by using chemical formulations that conform to the ZDHC MRSL.

Facilities should then ensure wastewater is treated prior to discharge in a way that either removes the chemical physically or by chemical reaction or biological degradation.

In order to achieve a unified approach for the textile and footwear industry, the ZDHC Programme encourages the adoption of these global guidelines by any organisation, consortia, and supplier interested in a more sustainable future.

### **Minimum Requirements**

#### 1 | Basic Expectations

For the purpose of these guidelines, at a minimum, each supplier is expected to:

- Have a valid license to operate.
- Comply consistently with wastewater discharge permits at all times.
  - This applies not only to industrial wastewater, but any domestic wastewater discharges that are not blended with the raw industrial wastewater.
  - Bypasses around wastewater treatment systems that are not permitted by authorities having jurisdiction are prohibited.
- If industrial and domestic wastewater are blended, the resultant blended wastewater is considered to be industrial wastewater for purposes of these guidelines.
- Follow generally-accepted process engineering best practices with respect to wastewater treatment and overall facility water efficiency management.
- Not dilute wastewater discharge with incoming water as a means to achieve compliance to concentration-based discharge permits.
- Properly classify sludge produced from wastewater treatment or zero-liquid discharge operations

as either hazardous or non-hazardous as defined by authorities having jurisdiction, and fully understand the final disposition of sludge wastes by third-party waste haulers.

 Contract out sludge hauling and disposal to licensed/permitted and qualified third parties that have appropriate facilities to properly dispose of the sludge wastes to ensure that sludge and leachates from the sludge do not adversely impact the environment.

#### 2 | Test Methods

- The test methods recommended in these guidelines are based on internationally recognised standard water and wastewater testing methodologies as well as government recognised testing requirements in the European Union, the United States of America, and China.
- It is expected that the standard test method used is the one most applicable for the region in which the wet manufacturing occurs.
- For the ZDHC MRSL listed substances/substance group, generally recognised standard tests methods are specified.

 Reporting limits for the ZDHC MRSL substances/substance groups stated within these guidelines are based on good laboratory practice criteria and capabilities for achieving these reporting limits globally.

#### 3 | **ZDHC Accepted Laboratories**

- ISO 17025 Accreditation, and;
- Passing an internal correlation test organised by one of the established ZDHC-accepted laboratories<sup>1</sup>.

ZDHC will update these guidelines as necessary and consider lower reporting limits over time.

<sup>1</sup> Acceptance process in development at time of publication.

### **Objectives**

These guidelines include analytical test methods and sampling procedures, with the ultimate objective of allowing ZDHC brands and their suppliers to share their testing results in a systematic and efficient manner via a ZDHC Data & Disclosure Platform.

The expected outcomes of using these guidelines are to:

- Ensure wastewater discharge does not have an adverse impact on communities and the environment.
- Create a unified monitoring and testing programme to aid suppliers to systematically and efficiently share discharge data with consumers, brands, and other interested parties.
- Reduce supplier operating costs and increase operational efficiencies by defining a standard cadence for wastewater and sludge testing and reporting requirements which applies to all consumer brands that adopt this guideline.
- Define pass/fail reporting limits for the analytical testing of hazardous chemicals in wastewater discharges and sludges produced during wastewater treatment operations.

These guidelines address conventional wastewater discharge parameters such as

pH, BOD₅, COD, etc, as noted in Table 1, Appendix A.

These guidelines also address the original priority chemical groups which are included in the ZDHC MRSL.

These chemical groups have been peer reviewed by independent third-party technical experts and industry associations involved in the production of key raw materials, and include:

- 1 | Alkylphenol (AP) and Alkylphenol Ethoxylates (APEOs), including all isomers
- 2 | Chlorobenzenes, Chlorotoluenes,
- 3 | Chlorophenols
- 4 | Dyes
  - 4.1 Azo (Forming Restricted Amines)4.2 Carcinogenic or Equivalent Concern4.3 Disperse (Sensitising)
- 5 | Flame Retardants
- 6 | Glycols
- 7 | Halogenated Solvents
- 8 | Organotin Compounds
- 9 | Perfluorinated and Polyfluorinated Chemicals (PFCs)
- 10 | Ortho-Phthalates Including all ortho esters of phthalic acid
- 11 | Polycyclic Aromatic Hydrocarbons (PAHs)
- 12 Volatile Organic Compounds (VOCs)

### Definitions

Conventional Wastewater Parameters: The notion of zero does not apply to conventional wastewater parameters such as temperature, pH, biological oxygen demand, chemical oxygen demand, etc. (Table 1, Appendix A). ZDHC brands acknowledge that those parameters are still relevant and very important for the textile and footwear industry. Therefore, these guidelines align

on those parameters with foundational, progressive and aspirational limit values.

<u>Detection Limit:</u> The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

<u>Direct Discharge</u>: A point source that discharges wastewater to streams, lakes, or oceans. Municipal and industrial facilities that introduce pollution through a defined conveyance or system such as outlet pipes are direct dischargers.

<u>Hazardous Chemicals</u>: Compounds that show intrinsically negative properties (persistent, bio-accumulative and toxic (PBT); very persistent and very bioaccumulative (vPvB); carcinogenic, mutagenic and toxic for reproduction (CMR); endocrine disruptors (ED)). Incoming Water: Water that is supplied to a manufacturing process, usually withdrawn from surface water bodies, groundwater, or collected from rainfall. This includes water supplied by municipalities, and condensate obtained from external sources of process steam.

Indirect Discharge: The discharge of wastewater to a treatment facility not owned and operated by the facility discharging the pollutants, for example a municipal wastewater treatment plant or industrial treatment park.

<u>Pretreatment:</u> The reduction of the amount of pollutants, the elimination of pollutants, or the alteration of the nature of pollutant properties in wastewater prior to the indirect discharge of the wastewater into a centralised or common wastewater treatment plant. Examples of pretreatment are: pH adjustment, filtration, other physical/chemical processes, and biological treatment of the wastewater.

<u>Raw Wastewater:</u> Wastewater that has not yet been treated prior to direct or indirect discharge from the facility, or prior to water recycling efforts. Reporting Limit: Lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. Reporting limits normally are arbitrarily set rather than explicilty determined by commercial analytical labs at concentrations above detection limits. They take into consideration variability associated with analysing samples from a wide variety of sources with many potential complicating factors, e.g. matrix effects. Good laboratory practice dictates that a reporting limit is 10 times the detection limit.

<u>Sludge</u>: The solids separated during the biological treatment of industrial or municipal wastewater.

<u>Wastewater</u>: Water no longer considered useable for a given operational purpose that is directly or indirectly discharged from the facility

<u>Wet Processing:</u> Manufacturing processes that use water as fluid that contacts the product being manufactured. For example, dyeing, finishing, printing, washing, and laundry processes. Non-contact, closedloop boiler or cooling water are not considered wet processing. Zero Discharge: For ZDHC brands, zero discharge is defined as not intentionally using hazardous chemicals or being a net contributor of hazardous chemicals to the environment. ZDHC brands monitor zero discharge by testing concentration of hazardous chemicals in wastewater and taking into consideration any background concentrations of those chemicals.

ZDHC MRSL: Manufacturing Restricted Substances List developed by the ZDHC Programme. Intentional use of substances on the MRSL is forbidden.

#### ZDHC Data & Disclosure Platform:

A centralised data platform for storing and reporting water and wastewater test results for the value chain of ZDHC contributors.

### Scope

These guidelines apply to industrial wastewater discharge and sludge produced from wastewater treatment operations for textile and footwear suppliers with wet processing facilities, including, but not limited to, textile dyeing and finishing, fabric mills, washing/laundry facilities, printing operations, vertical finished goods manufacturing, and fibre production.

These guidelines do not address wastewater management beyond the property boundaries of the suppliers; wastewater treatment or pretreatment systems that are not owned and operated by the suppliers; and they are not intended to apply to third-party, off-site, centralised or common wastewater treatment facilities not under direct control or ownership of the suppliers. Wastewater discharge from raw material production such as cotton farming, cattle ranching, leather processing, polymer production, wool scouring, etc., are out of scope of this guideline.

The ZDHC Programme acknowledges that conventional wastewater parameters are relevant for the textile and footwear industry. ZDHC proposes foundational, progressive and aspirational limit values for conventional parameters as part of this wastewater guidance document. Where local legislation and/or permits do not cover one or more conventional parameters listed in these guidelines, the foundational level stated in these guidelines shall apply.

Sampling, testing and reporting requirements as outlined in these guidelines are the same for facilities that directly or indirectly discharge wastewater. However, for the conventional wastewater parameters (Table 1, Appendix A), indirect dischargers will be held accountable to their wastewater discharge permit instead of the foundational, progressive, and aspirational limits defined in Table 1, Appendix A. Facilities discharging directly or indirectly will be required to submit a copy of their discharge permits to the ZDHC Programme. Facilities discharging indirectly will also be required to provide:

- 1 Name and location of the receiving centralised or common wastewater treatment plant;
- centralised or common wastewater treatment plant;
- that are in addition to the Table 1 parameters of these guidelines.

2 | Parameters and limit values agreed between the facility in question and the receiving

3 | Test results for the wastewater parameters that are included in the wastewater permit

### Disclaimer

- 1 The ZDHC Programme has prepared these guidelines as a guide to support environmental stewardship initiatives. These guidelines are not intended as a statement of legal requirements.
- 2 | The ZDHC Foundation makes no warranty, expressed or implied, concerning the contents of these guidelines and assumes no legal responsibility for its contents.
- 3 At a minimum, it is required that wastewater discharges are consistently compliant with the legal requirements and permits issued by the authorities having jurisdiction over individual supplier facilities. Where stricter legal, local or regional wastewater limits are in place, those limit values shall supersede the limit values in these guidelines.
- 4 | It is not the intent of the ZDHC Foundation to act as an agency reporting wastewater discharge data to governments or authorities having jurisdiction. It is expected that suppliers are accountable for reporting on their wastewater discharges in accordance with applicable laws.

## **The Guidelines**

### A. The Three-Level Approach

As manufacturing facilities are not identical in terms of capabilities, knowledge, strategic priorities, and resources, these guidelines provide a three-level approach for wastewater discharge limits which is consistent with other collaborations, including the Stockholm International Water Institute (SIWI), the Sustainable Apparel Coalition (SAC), and the Outdoor Industry Association (OIA). The intent is that suppliers actively execute a continuous improvement plan to reach the next level.

#### The levels are:

- Foundational: At a minimum, meets legal discharge requirements and ensures effective control of ZDHC MRSL chemicals.
- Progressive: Demonstrates increasing knowledge of chemical management and applies advanced wastewater treatment processes.
- Aspirational: Demonstrates best-in-class performance and strives for continuous improvement in both chemicals and wastewater treatment process knowledge; creates industry best practices.

### **B.** Parameters and Limits

- 1 Wastewater parameters are classified into two categories:
- Conventional Parameters. These parameters, their limits, and standard methods for analysis are defined in Table 1 in Appendix A.
- 1.2 ZDHC MRSL Parameters. These parameters, their reporting limits, and standard methods for analysis are defined for wastewater in Tables 2A 2N
- 1.3 For sludge, Table 3 Appendix A, paramaters and standard methods for analysis are defined.

### C. Sampling

1. Each facility is expected to develop written procedures that clearly identify and document the sampling point/s, sampling methodologies and reporting frequency, for the following sampling types:

1.1 | Discharged Wastewater

a. Wastewater sampling shall occur at a point closest to the location where the wastewater leaves the property of the facility. Please refer to
Figures 1 and 2 in Appendix B that identify sample point locations at facilities that, respectively, directly or indirectly discharge wastewater.

b. In the event that a facility has multiple permitted discharge locations, each discharge location shall have a sampling point, and sampling shall occur independently at each sampling point in accordance with these guidelines.

c. For instances where sampling at multiple wastewater discharge locations occurs, each wastewater sample taken shall be tested independently of the others; wastewater samples from multiple discharge points are not to be blended, but tested separately.

d. Wastewater being sampled shall be of the same quality which is discharged to beyond the facility property boundary.

e. Wastewater quality should not be altered after the testing point.

1.2 Raw Wastewater

a. Sampling of raw wastewater for testing of ZDHC MRSL parameters may be an alternative requirement by individual brands.

b. Raw wastewater testing will give further insights into the usage of ZDHC MRSL chemicals which may be diverted into the sludge during wastewater treatment.

#### Incoming Water 1.3

a. Incoming water shall be sampled at the point where the incoming water enters the facility, and prior to any on-site treatment.

b. The intent of collecting this sample is to assist with point source identification of hazardous chemicals in the event the wastewater test results indicate a hazardous chemical above the reporting limits.

c. In the event that a wastewater sample analysis results in a hazardous chemical above the reporting limits outlined in Appendix A, the incoming water sample shall be analysed to determine if the incoming water is contributing to the hazardous chemicals identified in the wastewater.

d. In the event that a wastewater or sludge sample analysis does not result in any hazardous chemicals above the reporting limits, this sample may be discarded without testing.

#### 1.4 Sludge

Sludge analysis from wastewater treatment is considered another factor in the verification of MRSL compliance. Testing of sludge or raw wastewater will be expected. Appropriate limits for sludge will be developed going forward.

#### 2 | Sampling Methodology

- Wastewater and sludge samples shall be collected as composite samples following 2.1 ISO 5667-13:2011 (Part 1,3, 10, 13 and 15): Water Quality Sampling Guidance for the preservation and handling of water samples.
- To ensure representative samples, composite sampling should be performed 2.2 for no less than six (6) hours , with no more than one hour between discrete samples. Each discrete sample shall be of equal volume. Sampling using calibrated autosamplers is preferred, but in instances where national standards do not require autosampling, laboratory personnel collecting samples are expected to meet the requirements of national sampling standards.

- 2.3 ensure the integrity of the sample.
- 2.4 In no circumstance shall samples be taken during times when the production process is not running or the wastewater is diluted due to heavy rainfall, etc.
- 2.5 laboratories.
- 2.6 water sources, a single grab sample from a common blend tank is acceptable. If no blend tank, one grab sample shall be collected from each incoming source.

#### 3 | Minimum Reporting Frequency

- **Conventional Parameters** 3.1 Semi-annually with testing and reporting completed by April 30 and October 31 of each year, and with no less than three months between testing and reporting. Permit or regulatory requirements for more frequent sampling and reporting may be required independent of these guidelines.
- 3.2 ZDHC MRSL Parameters Semi-annually with testing and reporting completed by April 30 and October 31 of each year, and with no less than three months between testing and reporting.

Samples shall be taken by qualified laboratory personnel. Laboratories performing sample collection must maintain a chain-of-custody log for each sample collected to

Suppliers are expected to allow for unannounced sampling by ZDHC-accepted

Incoming water may be a single grab sample. For facilities with multiple incoming

### **D.** Data Reporting

- 1 After permission from suppliers, wastewater, sludge, and incoming water test reports from ZDHC-accepted laboratories will be reported directly by laboratories to ZDHC contributors via the ZDHC Data & Disclosure Platform on the ZDHC website, making best use of available data standards. For any additional testing that may occur (beyond these guidelines), the manufacturing facility is encouraged to upload the data to the ZDHC Data & Disclosure Platform.
- 2 In the event that a test report value for direct dischargers either exceeds a foundational limit value for conventional parameters, or reporting limit for the ZDHC MRSL (as listed in Appendix A), or, for both direct and indirect dischargers, exceeds a legal permit limit, then the facility is expected to:
- Notify the applicable authorities of any permit violations, as well as notify the ZDHC 2.1 brand/s and/or other customers;
- Submit a corrective action plan with a defined completion date for resolution of the 2.2 excursion.
- Within thirty (30) calendar days of the excursion, upload to the ZDHC Data & 2.3 Disclosure Platform<sup>1</sup> the root cause analysis and corrective action plan to remediate the excursion.
- 2.4 Re-sample the sludge and wastewater to validate the excursion has been resolved, and upload data to the ZDHC Data & Disclosure Platform.
- 3 | To enable widespread adoption of these guidelines, and to optimise wastewater and sludge sampling across the value chain, the ZDHC Programme is collaborating with other industry organisations such as the Sustainable Apparel Coalition (SAC), the Outdoor Industry Association (OIA) and the Institute of Public & Environmental Affairs (IPE) to enable data sharing capabilities.
- Wastewater data may be made available to the public via the ZDHC Data & Disclosure Platform

<sup>1</sup> ZDHC Data & Disclosure Platform is currently in development, due for launch in 2017

### **E.** Schedule

- 1 Foundational limits for conventional wastewater parameters (Appendix A, Table 1) supplier's legal, permitted limits, suppliers are expected to meet compliance with
- 2 Progressive limits for conventional wastewater parameters (Appendix A, Table 1) are expected to be met or exceeded by:
- Facilities that start production after January 1, 2018. 2.1
- 2.2 that is operational after January 1, 2018.
- 2.3 expansion of capacity that is operational after January 1, 2018.
- 3 All facilities are expected to meet aspirational or progressive limits as early as possible and share best practices on how to achieve it.
- 4 Aspirational limits for conventional wastewater parameters (Appendix A, Table 1) are expected to be met by January 1, 2020. Suppliers are encouraged to continuously improve to achieve one of the following:
- 4.1 or
- 4.2 performance, and have a plan with milestones in place to achieve continuous improvement.
- to be fully met by suppliers by January 1, 2020. From January 2018, ZDHC expects suppliers to be able to provide evidence of a progressive schedule to phase out hazardous chemicals by 2020.

should already be met by suppliers. If the foundational limits are more restrictive than the foundational limits within a period of one year from publishing date of these guidelines.

An existing, operating facility, with a new onsite wastewater treatment system

A current production facility that undergoes enhancement and/or at least a 50 %

Attain and demonstrate performance that meets or exceeds aspirational performance;

In the absence of aspirational performance, attain and demonstrate progressive

5 | Reporting limits for ZDHC MRSL parameters (Appendix A, Table 2A to 2N) are expected

#### Table 2N:

Volatile Organic Compounds (VOC)

#### Table 3: Sludge

For information on single substances and CAS numbers please refer to table 2A - table 2N

\*Limit value column left blank pending further study and data collection over next year

Presence of the listed substances in sludge significantly above reporting limits in tables 2A-2N indicates the need for additional investigation of the complete chemical inventory and raw materials used in production processes to ensure MRSL compliance.

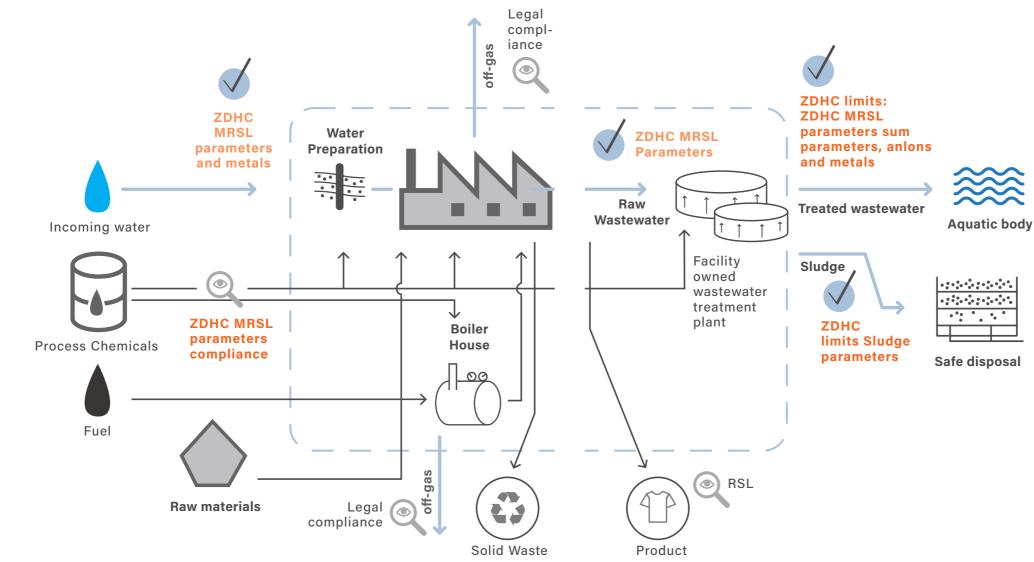

Substance or Substance Group	Reporting limit [mg/kg] dry matter*	Method
Arsenic		Acid digestion. ICP or ICP/MS
Cadmium		Acid digestion. ICP or ICP/MS
Chromium VI		Extraction in buffer solution. Derivatisation and UV or IC-ICP/ MS
Lead		Acid digestion. ICP or ICP/MS.
Mercury		Acid digestion. ICP or ICP/MS
Cyanide		ISO 14403-1,-2. ISO 11262
